① RF-cycle average

instantaneous $\sigma E(t)^2/\rho_m$: 0 to 5

average $\frac{1}{2}\sigma|\widetilde{E}|^2/\rho_m = 2.5$ W/kg

(if 100 V/m is an RMS value: 5 W/kg)

② spatial (mass) average

point SAR → mass average over V_a

depends on the size and shape of V_a

equals the point value if uniform

③ pulse-train average

envelope $\mathbf{c}(t)$: 1 ms in every 10 ms

2.5 W/kg during the pulse

long-term $0.1 \times 2.5 = 0.25$ W/kg
