
$$\nabla \cdot (\varepsilon_0 \mathbf{E}) = \rho_f - \nabla \cdot \mathbf{P}$$

$$\nabla \times (\mathbf{B}/\mu_0) = \mathbf{J}_f + \partial_t \mathbf{P} + \nabla \times \mathbf{M} + \varepsilon_0 \partial_t \mathbf{E}$$

$$\nabla \cdot \mathbf{D} = \rho_f, \quad \mathbf{D} = \varepsilon_0 \mathbf{E} + \mathbf{P}$$

$$\nabla \times \mathbf{H} = \mathbf{J}_f + \partial_t \mathbf{D}, \quad \mathbf{H} = \mathbf{B}/\mu_0 - \mathbf{M}$$

Both forms describe the same field; they differ only in which terms are booked as sources and which inside the field variables.
